

Importing Audio into your Digital Performer Session

Open a folder of audio files on the hard drive. With the mouse, drag an audio file from the folder into an audio track.

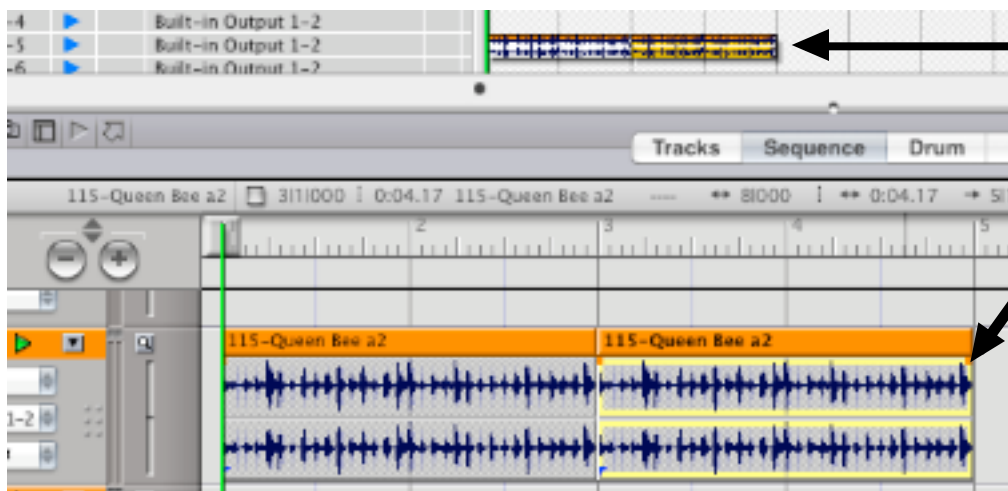

Note: A stereo file (such as drum loops, strings or sound effects) will only drag into a stereo audio track. A mono (such as a guitar, bass, or voice track) will only drag into a mono track. Audio tracks have two waves  and mono tracks have one .

The audio will appear in the track once you let go of the mouse.

Option-click on the audio and drag it to the right to copy it.

Double-click on the waveform from the Tracks view to open the audio track in Sequence view, giving you a larger, more flexible view of the audio.
